Overview

The purpose of the Revision Guide for AMD Family 17h Models 30h-3Fh is to communicate updated product information to designers of computer systems and software developers. This revision guide includes information on the following products:

- **AMD EPYC™ 7002 Series Processors**

Feature support varies by brands and OPNs (Ordering Part Number). To determine the features supported by your processor, contact your customer representative.

This guide consists of these major sections:

- **Processor Identification** shows how to determine the processor revision and workaround requirements, and to construct, program, and display the processor name string.

- **Product Errata** provides a detailed description of product errata, including potential effects on system operation and suggested workarounds. An erratum is defined as a deviation from the product's specification, and as such may cause the behavior of the processor to deviate from the published specifications.

- **Documentation Support** provides a listing of available technical support resources.

Revision Guide Policy

Occasionally, AMD identifies product errata that cause the processor to deviate from published specifications. Descriptions of identified product errata are designed to assist system and software designers in using the processors described in this revision guide. This revision guide may be updated periodically.
Conventions

Numbering

- **Binary numbers.** Binary numbers are indicated by appending a "b" at the end, e.g., 0110b.
- **Decimal numbers.** Unless specified otherwise, all numbers are decimal. This rule does not apply to the register mnemonics.
- **Hexadecimal numbers.** Hexadecimal numbers are indicated by appending an "h" to the end, e.g., 45F8h.
- **Underscores in numbers.** Underscores are used to break up numbers to make them more readable. They do not imply any operation. e.g., 0110__1100b.
- **Undefined digit.** An undefined digit, in any radix, is notated as a lower case "x".

Arithmetic and Logical Operators

In this document, formulas follow some Verilog conventions as shown in Table 1.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>{}</td>
<td>Curly brackets are used to indicate a group of bits that are concatenated together. Each set of bits is separated by a comma. E.g., {Addr[3:2], Xlate[3:0]} represents a 6-bit value; the two MSBs are Addr[3:2] and the four LSBs are Xlate[3:0].</td>
</tr>
<tr>
<td></td>
<td>Bitwise OR operator. E.g. (01b</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>&amp;</td>
<td>Bitwise AND operator. E.g. (01b &amp; 10b == 00b).</td>
</tr>
<tr>
<td>&amp;&amp;</td>
<td>Logical AND operator. E.g. (01b &amp;&amp; 10b == 1b); logical treats multibit operand as 1 if &gt;=1 and produces a 1-bit result.</td>
</tr>
<tr>
<td>^</td>
<td>Bitwise exclusive-OR operator; sometimes used as &quot;raised to the power of&quot; as well, as indicated by the context in which it is used. E.g. (01b ^ 10b == 11b). E.g. (2^2 == 4).</td>
</tr>
<tr>
<td>~</td>
<td>Bitwise NOT operator (also known as one's complement). E.g. (~10b == 01b).</td>
</tr>
<tr>
<td>!</td>
<td>Logical NOT operator. E.g. (!10b == 0b); logical treats multibit operand as 1 if &gt;=1 and produces a 1-bit result.</td>
</tr>
<tr>
<td>==</td>
<td>Logical &quot;is equal to&quot; operator.</td>
</tr>
<tr>
<td>!=</td>
<td>Logical &quot;is not equal to&quot; operator.</td>
</tr>
<tr>
<td>&lt;=</td>
<td>Less than or equal operator.</td>
</tr>
<tr>
<td>&gt;=</td>
<td>Greater than or equal operator.</td>
</tr>
<tr>
<td>*</td>
<td>Arithmetic multiplication operator.</td>
</tr>
<tr>
<td>/</td>
<td>Arithmetic division operator.</td>
</tr>
<tr>
<td>&lt;&lt;</td>
<td>Shift left first operand by the number of bits specified by the 2nd operand. E.g. (01b &lt;&lt; 01b == 10b).</td>
</tr>
<tr>
<td>&gt;&gt;</td>
<td>Shift right first operand by the number of bits specified by the 2nd operand. E.g. (10b &gt;&gt; 01b == 01b).</td>
</tr>
</tbody>
</table>

Register References and Mnemonics

In order to define errata workarounds it is sometimes necessary to reference processor registers. References to registers in this document use a mnemonic notation consistent with that defined in the Processor Programming Reference (PPR) for AMD Family 17 Model 30h-3Fh Processors, order# 55803.
Processor Identification

This section shows how to determine the processor revision.

Revision Determination

A processor revision is identified using a unique value that is returned in the EAX register after executing the CPUID instruction function 0000_0001h (CPUID Fn0000_0001_EAX). Figure 1 shows the format of the value from CPUID Fn0000_0001_EAX.

![Figure 1. Format of CPUID Fn0000_0001_EAX](image)

The following tables show the identification numbers from CPUID Fn0000_0001_EAX for each revision of the processor to each processor segment. "X" signifies that the revision has been used in the processor segment. "N/A" signifies that the revision has not been used in the processor segment.

| Table 2. CPUID Values for AMD Family 17h Models 30h-3Fh SP3 Processor Revisions |
|---------------------------------|---------------------------------|
| CPUID Fn0000_0001_EAX           | AMD EPYC™ 7002 Series Processors |
| 00830F10h (Rome-B0)             | X                                |

Mixed Processor Revision Support

AMD Family 17h processors with different revisions may not be mixed in a multiprocessor system.

Programming and Displaying the Processor Name String

This section, intended for system software programmers, describes how to program and display the 48-character processor name string that is returned by CPUID Fn8000_000[4:2]. The hardware or cold reset value of the processor name string is 48 ASCII NUL characters, so system software must program the processor name string before any general purpose application or operating system software uses the extended functions that read the name string. It is common practice for system software to display the processor name string and model number whenever it displays processor information during boot up.

Note: Motherboards that do not program the proper processor name string and model number will not pass AMD validation and will not be posted on the AMD Recommended Motherboard Web site.

The name string must be ASCII NUL terminated and the 48-character maximum includes that NUL character.
The processor name string is programmed by MSR writes to the six MSR addresses covered by the range MSRC001_00[35:30]h. Refer to the PPR for the format of how the 48-character processor name string maps to the 48 bytes contained in the six 64-bit registers of MSRC001_00[35:30].

The processor name string is read by CPUID reads to a range of CPUID functions covered by CPUID Fn8000_000[4:2]. Refer to CPUID Fn8000_000[4:2] in the PPR for the 48-character processor name string mapping to the 48 bytes contained in the twelve 32-bit registers of CPUID Fn8000_000[4:2].

**Operating System Visible Workarounds**

This section describes how to identify operating system visible workarounds.

**MSRC001_0140 OS Visible Work-around MSR0 (OSVW_ID_Length)**

This register, as defined in *AMD64 Architecture Programmer's Manual Volume 2: System Programming*, order# 24593, is used to specify the number of valid status bits within the OS Visible Work-around status registers.

The reset default value of this register is 0000_0000_0000_0000h.

System software shall program the OSVW_ID_LENGTH to 0005h prior to hand-off to the OS.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:16</td>
<td>Reserved.</td>
</tr>
<tr>
<td>15:0</td>
<td>OSVW_ID_LENGTH: OS visible work-around ID length. Read-write.</td>
</tr>
</tbody>
</table>

**MSRC001_0141 OS Visible Work-around MSR1 (OSVW_Status)**

This register, as defined in *AMD64 Architecture Programmer's Manual Volume 2: System Programming*, order# 24593, provides the status of the known OS visible errata. Known errata are assigned an OSVW_ID corresponding to the bit position within the valid status field.

Operating system software should use MSRC001_0140 to determine the valid length of the bit status field. For all valid status bits: 1=Hardware contains the erratum, and an OS software work-around is required or may be applied instead of a system software workaround. 0=Hardware has corrected the erratum, so an OS software work-around is not necessary.

The reset default value of this register is 0000_0000_0000_0000h.

<table>
<thead>
<tr>
<th>Bits</th>

## Product Errata

This section documents product errata for the processors. A unique tracking number for each erratum has been assigned within this document for user convenience in tracking the errata within specific revision levels. This table cross-references the revisions of the part to each erratum. “No fix planned” indicates that no fix is planned for current or future revisions of the processor.

*Note: There may be missing errata numbers. Errata that do not affect this product family do not appear. In addition, errata that have been resolved from early revisions of the processor have been deleted, and errata that have been reconsidered may have been deleted or renumbered.*

# Cross-Reference of Errata to Package Type

This table cross-references the errata to each package type. "X" signifies that the erratum applies to the package type. An empty cell signifies that the erratum does not apply. An erratum may not apply to a package type due to a specific characteristic of the erratum, or it may be due to the affected silicon revision(s) not being used in this package.

</table>
1140 Response Transaction May be Lost on Data Fabric

Description
Under a highly specific and detailed set of internal timing conditions, the CAKE (Data Fabric Coherent AMD socKet Extender) may lose a response transaction.

Potential Effect on System
System may hang or reset

Suggested Workaround
Program
- D18F3x2A4[28:25] to 4h, and
- D18F3x2A4[11:8] to 4h

System software may contain the workaround for this erratum.

Fix Planned
No fix planned
1146 PCIe® DPC (Downstream Port Containment) RP PIO (Root Port Programmed I/O) Error Reporting May Not Function Correctly

Description

The system resets to a state where an unmasked RP PIO error may produce unpredictable system behavior.

The DPC Extended Capability RP PIO SysError (PCIERCCFG::PCIE_RPPIO_SYSERROR) register incorrectly inverts the sense of its enable bits, so that a bit value of 0b enables the function and a bit value of 1b disables the function. In addition, when enabled an RP PIO System Error may not be handled correctly by the processor resulting in unpredictable system behavior.

The reset value of PCIERCCFG::PCIE_RPPIO_SYSERROR is 0000_0000h which, due to the inversion of the bits, enables RP PIO errors to be reported as a System Error. While the value of PCIERCCFG::PCIE_RPPIO_SYSERROR is 0000_0000h, clearing any of the mask bits in PCIERCCFG::PCIE_RPPIO_MASK will allow the corresponding error to be reported as a System Error.

Potential Effect on System

Unpredictable system behavior.

Suggested Workaround

Program PCIERCCFG::PCIE_RPPIO_SYSERROR[18:0] to 7_0707h. This disables the DPC RP PIO System Error feature.

System software may contain the workaround for this erratum.

Fix Planned

No fix planned
1150 PCIe® Incorrectly Updates Some AER (Advanced Error Reporting) Registers After Egress Blocking Error

Description
When a PCIe egress blocking error occurs, PCIe will incorrectly update the following AER registers:
- Header Log Register
- TLP Prefix Log Register
- Root Error Status register, Multiple ERR_FATAL/NONFATAL Received bit.

Potential Effect on System
After a PCIe egress blocking error, the system will not have access to accurate diagnostic information contained in the affected registers.

Suggested Workaround
None

Fix Planned
No fix planned
1154 MOV SS Instructions May Take Multiple Breakpoints

Description
Under a highly specific and detailed set of internal timing conditions, the MOV SS instruction may prematurely clear the RFLAGS RF bit if:

- RFLAGS TF bit is asserted, and
- the instruction hits a debug breakpoint, and
- an interrupt is taken by the affected instruction before it completes.

Potential Effect on System
The affected instruction may take multiple instruction breakpoints.

Suggested Workaround
None

Fix Planned
No fix planned
1155 DMA or Peer-to-peer Accesses Using Guest Physical Addresses (GPAs) May Cause IOMMU Target Abort

Description
In systems where:
• Virtualization is enabled, and
• IOMMU is in pass-through mode
DMA or peer-to-peer accesses using Guest Physical Addresses (GPAs) occurring within the regions defined below trigger a target abort.
• 0x00FD_0000_0000->0x00FD_F8FF_FFFF, or
• 0x00FD_F910_0000->0x00FD_F91F_FFFF, or
• 0x00FD_FB00_0000->0x00FD_FFFF_FFFF

Potential Effect on System
A DMA device will receive a target abort from the IOMMU.

Suggested Workaround
System software must mark the following block of memory as reserved:
• FD_0000_0000 -> FD_FFFF_FFFF

Fix Planned
No fix planned
1157 PCIe® Link Status May be Incorrect When Root Port Autonomously Changes to Gen4 Speed

Description
When the PCIe® root port autonomously changes to Gen4 speed, the following will occur:

- Link Status Register (Offset 12h) [15] Link Autonomous Bandwidth Status will incorrectly not be asserted. If Link Status Control (Offset 10h) [15] Link Autonomous Bandwidth Interrupt Enable is asserted, an interrupt may fail to occur.
- Link Status Register (Offset 12h) [14] Link Bandwidth Management Status will be incorrectly asserted. If Link Status Control (Offset 10h) [14] Link Bandwidth Management Interrupt Enable is asserted, a spurious interrupt will occur.

Potential Effect on System
Software may incorrectly handle an autonomous change to PCIe Gen4 Speed.

Suggested Workaround
None

Fix Planned
No fix planned
1159 Writes to Base Frequency Register May be Ignored

Description
If the base frequency register, (MSRC001_0064[CpuDfsId], MSRC001_0064[CpuFid]):

- is programmed to a lower frequency than the default reset value, and
- the default base frequency is not a multiple of 100 MHz

then subsequent writes to the register that are greater than the next lower multiple of 100 MHz may be ignored.

Potential Effect on System
Software may report an incorrect value of base frequency.

Suggested Workaround
None

Fix Planned
No fix planned
1160 SdpParity and XiVictimQueue Mask Bits Incorrectly Mask Additional Errors

Description
If MCA::L3::MCA_CTL_MASK_L3[5] (SdpParity) is set then errors logged in MCA_STATUS_L3 that set MCA_STATUS_L3[ErrorCodeExt]=0x5 are correctly masked, and some system read data errors logged in MCA_STATUS_LS or MCA_STATUS_IF are masked incorrectly.

If MCA::L3::MCA_CTL_MASK_L3[6] (XiVictimQueue) is set then errors logged in MCA_STATUS_L3 that set MCA_STATUS_L3[ErrorCodeExt]=0x6 are correctly masked, and some system read data errors logged in MCA_STATUS_LS are masked incorrectly.

Potential Effect on System
Some system read data errors logged in MCA_STATUS_LS or MCA_STATUS_IF may fail to be detected.

Suggested Workaround
Do not program MCA::L3::MCA_CTL_MASK_L3[5] or MCA::L3::MCA_CTL_MASK_L3[6] to 1b.

Fix Planned
No fix planned
1163 Some MCA_MISC0 Bits May Fail to Persist Through Warm Reset

Description
The following warm-reset persistent bits may incorrectly be cleared during a warm reset:

- MCA_MISC0_DE[43:32], ErrCnt
- MCA_MISC0_DE[48], Ovrflw
- MCA_MISC0_DE[50:49], ThresholdIntType
- MCA_MISC0_EX[43:32], ErrCnt
- MCA_MISC0_EX[48], Ovrflw
- MCA_MISC0_EX[50:49], ThresholdIntType
- MCA_MISC0_IF[43:32], ErrCnt
- MCA_MISC0_IF[48], Ovrflw
- MCA_MISC0_IF[50:49], ThresholdIntType

Potential Effect on System
A corrected error count in some MCA banks will be lost over a warm reset.

Suggested Workaround
None

Fix Planned
No fix planned
1165 The PCIe® Link May Accumulate Correctable Errors in Some Gen3 Mode Configurations

Description
The PCIe® link may accumulate correctable receiver errors due to spurious entries into recovery or accumulate correctable errors due to NAKs (Negative Acknowledgements) in the following configurations:

- Gen3 mode, Link width x1
- Gen3 mode, Link width x4

A link that degrades to one of the affected modes from a different mode will accumulate correctable errors as if it was originally configured to operate in the affected mode.

Potential Effect on System
Unexpected NAKs may occur, and the processor root complex may report correctable errors.

Suggested Workaround
System software may contain the workaround for this erratum.

Fix Planned
No fix planned
1166 The PCIe® Link May Accumulate Correctable Errors in Gen4 Link Width x2 Mode

Description
The PCIe® link may accumulate correctable receiver errors due to spurious entries into recovery or accumulate correctable errors due to NAKs (Negative Acknowledgements) in Gen4 Link width x2 mode.

A link that degrades to the affected mode from a different mode will accumulate correctable errors as if it was originally configured to operate in the affected mode.

Potential Effect on System
Unexpected NAKs may occur, and the processor root complex may report correctable errors.

Suggested Workaround
None

Fix Planned
No fix planned
1169 PCIe® Error Masking May Fail to Mask Errors

Description
If MCA_Ctl_MASK_NBIO[PCIE_sideband] is programmed to 0b, then PCIe® error masking, including Uncorrectable Error Mask and Correctable Error Mask, will not mask errors.

Potential Effect on System
Masked errors will incorrectly be reported to the system.

Suggested Workaround
Program MCA_Ctl_MASK_NBIO[PCIE_sideband] to 1b.
System software may contain the workaround for this erratum.

Fix Planned
No fix planned
1171 Requester ID May Be Set Incorrectly on Outbound PCIe® VDMs (Vendor Defined Messages)

Description
The Requester ID may be set incorrectly on Outbound PCIe® VDMs (Vendor Defined Messages) if the Type field indicates:

- Broadcast from the Root Complex,
- Routed to the Root Complex, or
- Routed by ID.

VDMs will be transmitted correctly within PCIe devices attached to the following groups of processor pins, but not between the groups.

- Group 0: P0_*, G0_*, WAFL_*
- Group 1: P1_*, G1_*
- Group 2: P2_*, G2_*
- Group 3: P3_*, G3_*

MCTP (Management Component Transport Protocol) is the only defined and validated usage of PCIe VDMs on AMD platforms.

Potential Effect on System
System may be unable to route responses of VDM protocols. The receiving device may be unable to determine the source of the request.

Suggested Workaround
None

Fix Planned
No fix planned
1183 The Processor May Hang If it Receives INIT# While Already In the INIT# State

Description
The processor may hang if it receives INIT# while already in the INIT# state.

Potential Effect on System
System may hang or reset.

Suggested Workaround
System software may contain the workaround for this erratum.

Fix Planned
No fix planned
1185 PCIe® Receive Buffer Location May Be Incorrectly Overwritten

Description
Under a highly specific and detailed set of internal timing conditions, a PCIe® receive buffer SRAM location in the host controller may be incorrectly overwritten.

Potential Effect on System
None with BIOS incorporating AGESA RomePI-SP3_1.0.0.3 or later.
Running software prior to AGESA RomePI-SP3_1.0.0.3 may result in unpredictable system behavior and possible logging of uncorrectable parity error(s) in MCA_STATUS_NBIO due to incorrect data in PCIe buffer.

Suggested Workaround
BIOS incorporating AGESA RomePI-SP3_1.0.0.3 or later contains a workaround for this erratum.

Fix Planned
No fix planned
1200 xHCI Host May Hang If Full Speed or High Speed USB Hub is Connected

Description
xHCI Host controller may hang if:
- A high speed or full speed flash device is connected to the host, and
- A high speed or full speed hub is connected to the host, and
- An active device is connected to the hub.

Potential Effect on System
xHCI Host controller may hang.

Suggested Workaround
System software may contain the workaround for this erratum.
Program USB0x00C60C[12:9] to 0001b.
Program USB1x00C60C[12:9] to 0001b.
Program USB0x00C608[6:5] to 00b.
Program USB1x00C608[6:5] to 00b.

Fix Planned
No fix planned
1212 IBS (Instruction Based Sampling) Micro-Op Retire Counters May Be Inaccurate

Description
Under a highly specific and detailed set of internal timing conditions the processor may experience sampling inaccuracies in the following IBS (Instruction Based Sampling) counters:

- MSRC001_1035[IbsTagToRetCtr] (micro-op tag to retire count)
- MSRC001_1035[IbsCompToRetCtr] (micro-op completion to retire count)

Potential Effect on System
Software reading the IBS OP Data register may experience inaccuracies.

Suggested Workaround
None

Fix Planned
No fix planned
1215 IBS (Instruction Based Sampling) Counter Valid Value May be Incorrect After Exit From Core C6 (CC6) State

Description
If a core's IBS feature is enabled and configured to generate an interrupt, including NMI (Non-Maskable Interrupt), and the IBS counter overflows during the entry into the Core C6 (CC6) state, the interrupt may be issued, but an invalid value of the valid bit may be restored when the core exits CC6.

Potential Effect on System
The operating system may receive interrupts due to an IBS counter event, including NMI, and not observe an valid IBS register. Console messages indicating ”NMI received for unknown reason” have been observed on Linux systems.

Suggested Workaround
None

Fix Planned
No fix planned
1216 IOMMU May Not Re-Walk Page Tables on a Present/Permission Fault

Description
Under a highly specific and detailed set of internal timing conditions, the IOMMU may not re-walk page tables on a present/permission fault.

Potential Effect on System
An IO device may see an unexpected completer abort.

Suggested Workaround
System software may contain the workaround for this erratum.
Program IOMMUL2B0x00000150[16] to 1b,and
Program IOMMUL2B1x00000150[16] to 1b, and
Program IOMMUL2B2x00000150[16] to 1b, and
Program IOMMUL2B3x00000150[16] to 1b.

Fix Planned
No fix planned
1218 EXITINFO1[2] May Be Incorrectly Set When GMET (Guest Mode Execute Trap extension) is Enabled

Description
EXITINFO1[2] (User/Supervisor bit) may incorrectly be one during a nested page fault if GMET (Guest Mode Execute Trap extension) is enabled.

Potential Effect on System
Software may not be able to determine whether a fault was a GMET fault or an NX fault based on EXITINFO1.

Suggested Workaround
Software must read the relevant VMCB to determine whether a fault was a GMET fault or an NX fault.

Fix Planned
No fix planned
1225 MCA_STATUS_CS[ErrorCode] May Be Incorrect After Some Machine Check Errors

Description
For some machine check errors, the MCA_STATUS_CS[ErrorCode] memory transaction type (RRRR) field incorrectly contains the value 0101b (Instruction Fetch) for all transaction types.

This erratum affects errors logged with the following MCA_STATUS_CS[ErrorCodeExt]:

- FTI_Ill_REQ
- FTI_ADDR_VIOL
- FTI_SEC_VIOL
- FTI_Ill_RSP
- FTI_RSP_NO_MTCH
- SPF_PRT_ERR
- SDP_RSP_NO_MTCH
- SDP_UNEXP_RETRY
- CNTR_OVFL
- CNTR_UNFL

Potential Effect on System
None expected. Software is expected to primarily rely on MCA_STATUS_CS[ErrorCodeExt] to identify errors.

Suggested Workaround
None. Software should use MCA_STATUS_CS[ErrorCodeExt] to identify errors and ignore MCA_STATUS_CS[ErrorCode] RRRR value for the error types listed above.

Fix Planned
No fix planned
1235 Guest With AVIC (Advanced Virtual Interrupt Controller) Enabled May Fail to Process IPI (Inter-Processor Interrupt) Until Guest Is Re-Scheduled

Description
Under a highly specific and detailed set of internal timing conditions, if a guest with AVIC enabled is about to be de-scheduled by the hypervisor, it may fail to process an IPI until after the guest is re-scheduled.

Potential Effect on System
A guest may not process an IPI until the guest is re-scheduled.

Suggested Workaround
None. Do not enable AVIC.

Fix Planned
No fix planned
1277 IOMMU May Mishandle Fault on Skipped Page Directory Entry Levels

Description
When Guest Page Tables and Nested Page Tables are enabled, if a nested page table walk skips a PDE (Page Directory Entry) level when the virtual address bits are non-zero, the IOMMU may fail to abort the request, and fail to generate an IO page fault.

Potential Effect on System
None expected. Properly coded software will program the virtual address bits associated with a skipped page level to all zero.

Suggested Workaround
Program the virtual address bits associated with a skipped page level to all zero.

Fix Planned
No fix planned
1286 Spurious #GP May Occur When Hypervisor Running on Another Hypervisor

Description
The processor may incorrectly generate a #GP fault if a hypervisor running on a hypervisor attempts to access the following secure memory areas:

- The reserved memory address region starting at FFFD_0000_0000h and extending up to FFFF_FFFF_FFFh.
- ASEG and TSEG memory regions for SMM (System Management Mode)
- MMIO APIC Space

Potential Effect on System
Software running a hypervisor on a hypervisor may encounter an unexpected #GP fault.

Suggested Workaround
If CPUID bit fn8000_000A EDX[28] = 0b, then:

- Hypervisor software can trap #GP faults that potentially have this issue and ignore #GP faults that were erroneously generated.

If CPUID bit fn8000_000A EDX[28] = 1b, then the issue has been fixed and no workaround is necessary.

Fix Planned
No fix planned
1288 A VDPPS Instruction May Fail to Record a Masked Exception in the MXCSR Register

Description
A 256-bit VDPPS instruction will fail to record a masked exception in the MXCSR register when:
• An unmasked exception is detected on one 128-bit section in the addition phase of the instruction, and
• A masked exception is detected on the other 128-bit section in the addition phase of the instruction.

Potential Effect on System
None expected.

Suggested Workaround
None

Fix Planned
No fix planned
1290 GMI (Global Memory Interface) Link May Hang Due to Failure To Retrain After Encountering CRC Errors

Description

GMI Link may hang due to failure to retrain after encountering correctable CRC errors. As a result, the following system errors may be observed:

- EX Watchdog Timeout (MCA::EX::MCA_STATUS_EX[ErrorCodeExt] = 0h) on one or more cores
- PCIe Completion Timeout (PCIe Uncorrectable Error Status register bit 14 = 1b)
- DF HW_ASSERT error (MCA::PIE::MCA_STATUS_PIE[ErrorCodeExt] = 0h)

Any of the above errors may be preceded by one or more occurrences of the following error:

- GMI correctable CRC errors (MCA::PIE::MCA_STATUS_PIE[ErrorCodeExt] = 2h, MCA::PIE::MCA_SYND_PIE[17] = 1b)

Potential Effect on System

System may hang or reset.

Suggested Workaround

System software may contain a workaround for this issue.

Fix Planned

No fix planned
1291 Certain Performance Counters For Retire Based Events May Overcount

Description
The processor may experience sampling inaccuracies that cause the following performance counters to overcount retire-based events.

- PMCx0C0 [Retired Instructions]
- PMCx0C1 [Retired Uops]
- PMCx0C2 [Retired Branch Instructions]
- PMCx0C3 [Retired Branch Instructions Mispredicted]
- PMCx0C4 [Retired Taken Branch Instructions]
- PMCx0C5 [Retired Taken Branch Instructions Mispredicted]
- PMCx0C8 [Retired Near Returns]
- PMCx0C9 [Retired Near Returns Mispredicted]
- PMCx0CA [Retired Indirect Branch Instructions Mispredicted]
- PMCx0D1 [Retired Conditional Branch Instructions]
- PMCx1C7 [Retired Mispredicted Branch Instructions due to Direction Mismatch]
- PMCx1D0 [Retired Fused Branch Instructions]

Potential Effect on System
Inaccuracies in performance monitoring software may be experienced.

Suggested Workaround
None
Software may enable another counter by setting PMC0x22[4] with a value of 1b. After reading the initial counter, if the second counter (with PMC0x22[4] set to 1b) is read and the count is zero, then the overcounting did not occur.

Fix Planned
No fix planned
1294 xHCI Controller May Drop Data of an Isochronous TD (Transfer Descriptor) During Isochronous Transfer

Description
When an Evaluate Context Command modifies the Max Exit Latency value when an Isochronous transfer is in progress, the xHCI controller may drop the data of an Isochronous TD of the endpoint associated with the Device Slot targeted by the Evaluate Context Command. This may result in the xHCI issuing an MSE (Missed Service Error).

Potential Effect on System
Isochronous Audio or Video transfers may experience momentary data loss within a 750 microsecond timeout window, after which isochronous transfer will resume.

Suggested Workaround
None

Fix Planned
No fix planned
1305 AHCI Controller Ignores COMINIT During HP6: HR_AwaitAlign State

Description
In HP6: HR_AwaitAlign state, while the AHCI controller is awaiting valid ALIGN patterns from connected SATA device, it will not respond to COMINT issued by the connected SATA device.

Potential Effect on System
If the attached SATA device sends COMINIT instead of valid ALIGN patterns in HP6:HR_AwaitAlign state, the AHCI controller will time out awaiting valid ALIGN patterns. Consequently the AHCI controller will re-initiate Out-of-band signaling sequence at the next highest supported speed. This may result in the attached SATA device running at the lower speed.

Suggested Workaround
None

Fix Planned
No fix planned
1308 Guests With AVIC (Advanced Virtual Interrupt Controller) Enabled May Not Be Able to Program Interrupt Controller

Description
When AVIC (Advanced Virtual Interrupt Controller) is enabled, the processor may fail to redirect accesses to the AVIC backing page if the system PA (Physical Address) for APIC_BAR (Advanced Programmable Interrupt Controller Base Address Register) in the nested page table is an MMIO (Memory Mapped IO) address.

Potential Effect on System
Guests with AVIC enabled may not be able to program the interrupt controller.

Suggested Workaround
Ensure that the system PA for APIC_BAR in the nested page table is not an MMIO address.

Fix Planned
No fix planned
1315 Two Processor System Configured With 3-link xGMI and Preferred IO Mode May Hang or Reset

Description
A two processor system configured with 3-link xGMI and preferred IO mode may hang or reset.

Potential Effect on System
System may hang or reset.

Suggested Workaround
System software may contain the workaround for this erratum.

Fix Planned
No fix planned
Documentation Support

The following documents provide additional information regarding the operation of the processor:

- **AMD64 Architecture Programmer's Manual Volume 1: Application Programming**, order# 24592
- **AMD64 Architecture Programmer's Manual Volume 2: System Programming**, order# 24593
